

ABSTRACT

A conveyance apparatus, including:

a supporting device having a through hole passing in a gravity direction, to support a glass material in a fluid or semi-fluid condition; and

a supplying device to supply a fluid into the through hole;

wherein when the glass material is dropped into the through hole, it is supported by the fluid in the through hole, under a non-physical contact condition, and when the glass material is not supported by change of the force of the fluid, it drops from a lower end of the through hole to an outside.
